Myocarditis Following COVID-19 Vaccination: A Case Series
Review COVID-19

疫苗接種後的心肌炎：案例回顧

Abstract 摘要：

The emergence of the COVID-19 pandemic prompted rapid vaccine development, resulting in the widespread administration of COVID-19 vaccines worldwide. While vaccines have proven highly effective in reducing the spread of the virus and the severity of the disease, there have been isolated reports of myocarditis occurring following vaccination. This abstract presents a case series review of myocarditis cases associated with COVID-19 vaccination, with a particular focus on the diagnostic and prognostic insights gained through the utilization of Cardiac Magnetic Resonance Imaging (Cardiac MRI).

Our review includes a comprehensive analysis of clinical presentations, patient demographics, and the timing of myocarditis onset in individuals post-vaccination. By examining these cases, we aim to shed light on the potential causal relationship between COVID-19 vaccination and myocarditis, as well as the role of Cardiac MRI in aiding diagnosis and monitoring disease progression.
